

CS 113 – Computer Science I

Lecture 21 – Runtime

Tuesday 11/26/2024

Announcements

HW 10 – Due Wednesday 11/25

HW11: Building 2 Fancy classes that keeps track of Strings

- SuperDuperArray
- SuperDuperSortedArray

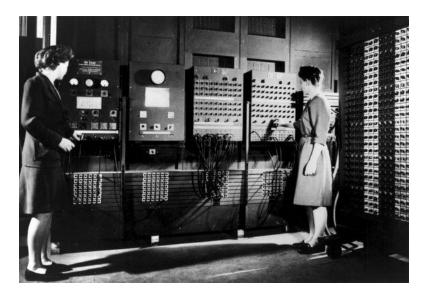

Mid-semester feedback form: https://forms.gle/Ed7G9oe74QQBT5sy5

Midterm 2: Thursday December 5th

Final: Wednesday 12/18 9:30am-12:30pm Park 238

Measuring performance

How do we quantify performance?

11/26/2024

Computing the speed of your programs

Compute the time needed to execute a function

```
import java.lang.System.*;
public static void main(String[] args) {
  double start = System.currentTimeMillis()/1000.0; // converts to seconds
  bubbleSort(L);
  double end = System.currentTimeMillis()/1000.0;
  System.out.printf("Time: %.10f", (end-start));
```

Runtime analysis: Big-O notation

Quantifies worse-case performance theoretical measure of how performance changes with input size

Advantages

Hardware-independent measure

Allows us to analyze different approaches without implementing the algorithm first

Big-O counting

defining, assigning variables (1 step)

• printing, reading input (built-in function calls: "k" steps)

• mul, divide, sub, add, mod, etc (1 step)

testing conditions (1 step)

Big-O Example – Compute a sum

```
int sum = 0;
int i = 0;
while (i < n) {
   sum = sum + i;
   i++;
}
System.out.println(sum);</pre>
```

```
a)
int n = getInputSize();
for (int i = 0; i < n; i++) {
    System.out.println(i);
}</pre>
```

(

```
b)
int n = getInputSize();
for (int i = 0; i < 100; i++) {
    System.out.println(i*n);
}</pre>
```

(

```
c)
int n = getInputSize();
for (int i = 0; i < n; i++) {
    System.out.println(i);
}

for (int j = 0; j < n; j++) {
    System.out. println(j);
}</pre>
```

```
d)
int n = getInputSize();
for (int i = 0; i < n; i++) {
    for (int j = 0; j < n; j++) {
        System.out.println(i, j);
    }
}</pre>
```

```
e)
int n = getInputSize();
for (int i = 0; i < n; i++) {
    for (int j = i; j < n; j++) {
        System.out.println(i, j);
    }
}</pre>
```

```
h)
int[] lst = {1,2,3,5,7,12,19,34,55,67,99,101};
int n = lst.length;
int mid = floor(n/2);
System.out.println(lst[mid]);
```

```
int n = getInputSize();
for (int i = 0; i < n; i++) {
    k = n;
    while (k > 1) {
        System.out.println(i, k);
        k = k/2;
    }
}
```

```
f)
int n = getInputSize();
for (int i = 0; i < n; i++) {
    for (int j = 0; j < 10; j++) {
        printIn(i, j);
    }
}</pre>
```

```
g)
int n = getInputSize();
while (n > 1) {
    println(n);
    n = n/2;
}
```

Linear Search - revisited

```
public static int LinearSearch(int x, int[] L) {
    int index = -1;
    for (int i = 0; i < L.length; i++) {
        if (L[i] == x) {
            index = i;
        }
    }
    return index;
}</pre>
```

Binary Search – what is the runtime?

```
public static int search(int x, int[] L) {
    int low = 0;
    int high = L.length-1;
    while (low <= high) {
      int mid = (low + high)/2;
      if (x > L[mid]) {
         low = mid+1;
      else if (x < L[mid]) {
         high = mid-1;
      else {
         return mid;
    return -1;
```

BubbleSort Revisited – What is the runtime?

```
public static void bubbleSort(int[] L) {
  for (int n = 0; n < L.length; n++) {
   for (int j = 1; j < L.length-n; j++) {
    if (L[j-1] > L[j]) {
      swap(j-1, j, L);
```

Comparisons in BubbleSort

How many comparisons do we need to make to sort a list of size n?

$$\frac{n(n-1)}{2}$$

Why? (draw on the board)

$$\frac{n(n-1)}{2} = \frac{n^2 - n}{2}$$

So what's the Big-Oh?

$$O(n^2)$$

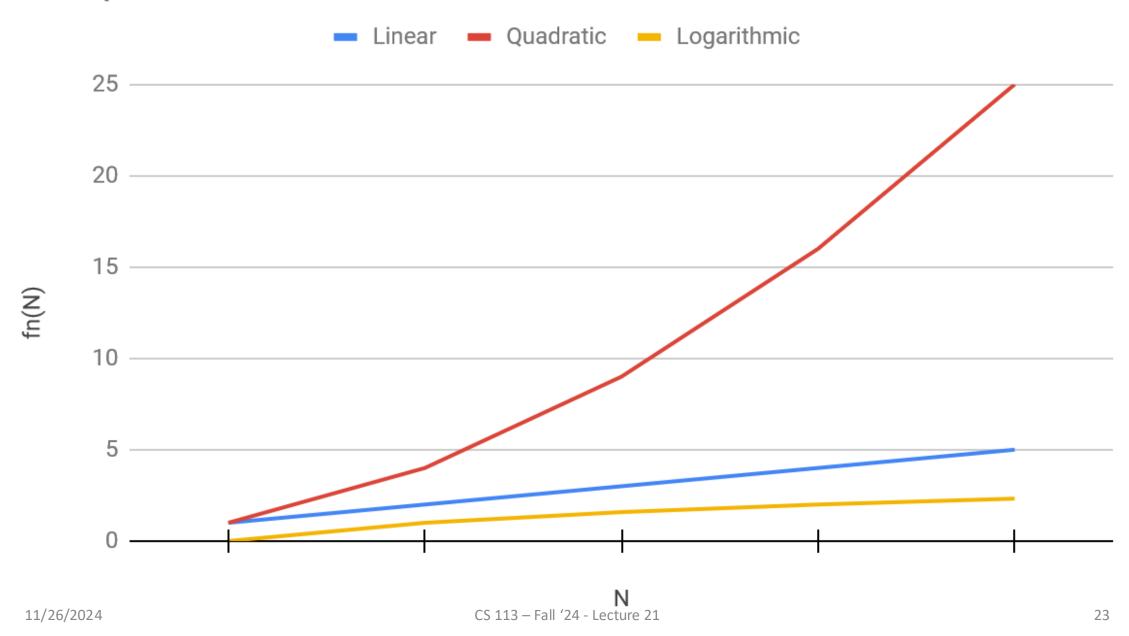

BubbleSort Revisited – What is the runtime?

```
public static void bubbleSort(int[] L) {
  for (int n = 0; n < L.length; n++) {
   for (int j = 1; j < L.length-n; j++) {
    if (L[j-1] > L[j]) {
      swap(j-1, j, L);
```

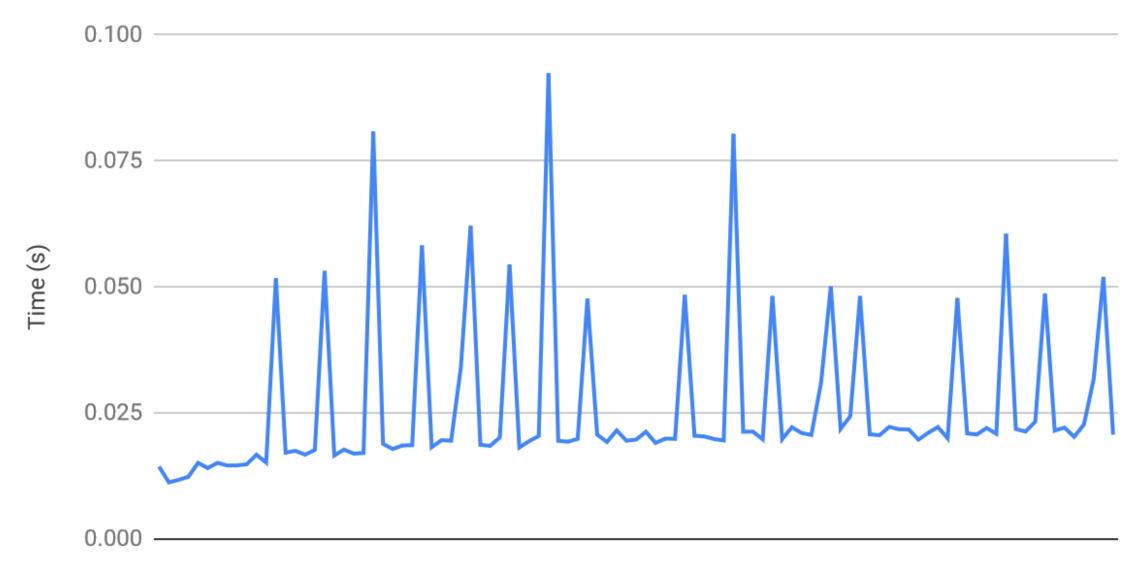

SelectionSort Revisited – What is the runtime?

```
public static void selectionSort(int[] L) {
 for (int i = 0; i < L.length; i++) {
   int minIdx = i;
   for (int j = i+1; j < L.length; j++) {
    if (L[j] < L[minIdx]) {
     minIdx = j;
   swap(i, minIdx, L);
```

Comparison of runtimes

Binary search

Linear Search
